

# Speed up your searches!

Satoshi Kawasaki | Splunk4Good Ninja

September 28<sup>th</sup>, 2017 | Washington, DC

# Forward-Looking Statements

During the course of this presentation, we may make forward-looking statements regarding future events or the expected performance of the company. We caution you that such statements reflect our current expectations and estimates based on factors currently known to us and that actual events or results could differ materially. For important factors that may cause actual results to differ from those contained in our forward-looking statements, please review our filings with the SEC.

The forward-looking statements made in this presentation are being made as of the time and date of its live presentation. If reviewed after its live presentation, this presentation may not contain current or accurate information. We do not assume any obligation to update any forward looking statements we may make. In addition, any information about our roadmap outlines our general product direction and is subject to change at any time without notice. It is for informational purposes only and shall not be incorporated into any contract or other commitment. Splunk undertakes no obligation either to develop the features or functionality described or to include any such feature or functionality in a future release.

# Bio: Satoshi Kawasaki

Splunk4Good Ninja

BS in Aerospace Engineering from Georgia Tech

## ► Also joined Splunk in 2013

- 3 years of Professional Services (PS)
- 1+ year of Splunk4Good

## ► Unofficially became a dashboard/visualization specialist in PS

- .conf 2014: *I Want that Cool Viz in Splunk!*
- .conf 2015: *Enhancing Dashboards with JavaScript!*

## ► Doing 3 talks this year

- .conf 2017: *Speed up your searches!*
- .conf 2017: *Splunking to fight human trafficking*
- .conf 2017: *Splunking the 2016 presidential election*

hobbes3

You are  
here.

# Splunk4Good

Big data can make a big difference

NETHOPE

TEAM  
RUBICON

npower

- ▶ \$100 million Splunk Pledge has issued licenses and training worth over \$6 million
- ▶ Provide workforce training to veterans and opportunity youth to train the workforce of tomorrow
- ▶ Engaging our partners in initiatives to promote STEM and develop shared solutions for humanitarian response and human trafficking
- ▶ Supporting life-changing research at top universities
- ▶ More than 70,000 hours of paid volunteer time

# Dashboards are like web pages

Because all good searches become dashboards

"For every one second delay, conversions dropped by 7%"

"2 seconds is the threshold for ecommerce website acceptability. We aim for under a half second."

"For every one second past 2 seconds a Splunk dashboard loads, the user becomes 20% more likely to open YouTube, Facebook, or 4chan."

# Scheduled searches

---

"It's my search and I need it now!"

# Scheduled search

For dashboard panels

Panel status shows the 39 minute "delay" in the scheduled search.

1 Jobs App: .conf 2017 - Speed up your searches! (conf\_2... Owner: All Status: All label="conf\_2017" 10 Per Page

Edit Selected

	Owner	Application	Events	Size	Created at	Expires	Runtime	Status	Actions
>	admin	conf_2017	2,251,967	100 KB	Aug 3, 2017 4:09:00 AM	Aug 5, 2017 4:10:40 AM	00:01:40	Done	Job

[conf\\_2017](#) [7/19/17 1:47:03.000 AM to 8/3/17 4:09:00.000 AM]

Job Inspector (or "View Recent" from "Searches, reports, and alerts") shows how long the search actually took and when the search last ran.

# Scheduled search

## Pros and cons

- ▶ Searches instantly load from disk
- ▶ Good for "static" dashboards (like single value KPIs for TV displays)
- ▶ Better than saving to lookups for static data<sup>[1]</sup>

- ▶ Less flexibility on search parameters, like you can't increase the time range
- ▶ Results delayed up to the scheduled interval
- ▶ Managing a saved search per panel could be a pain

[1]Unless you're really working with unreliable test data

# Post-process searches

One construction worker working, the rest standing

# Post-process searches

For dashboards

```

<dashboard>
  <search id="root">
    <query>
      index=meraki sourcetype=meraki_syslog log_type=urls
      | sistats dc(mac) by device
    </query>
  </search>
  <row>
    <panel>
      <chart>
        <search base="root">
          <query>stats dc(mac) by device</query>
        </search>
        <option name="charting.chart">pie</option>
      </chart>
      <single>
        <search base="root">
          <query>stats dc(mac)</query>
        </search>
      </single>
    </panel>
  </row>
</dashboard>

```

Two searches driven by one base search (aka the "data cube").

Both post-process searches will complete at the same time.

N/A

# Post-process search

## Pros and cons

- ▶ Post-process searches share the same processing usage of the base search
- ▶ As long as the base search doesn't change, changes in post-process is very fast (ie using \$tokens\$)
- ▶ Less validation on search results when post-processing from a "data cube"

- ▶ Must be done in Simple XML (no UI option as of Splunk 6.6)

```
130.60.4 - - [07/Jan 18:10:57:153] "GET /category.screen?category_id=GIFTS&JSESSIONID=5D15LAF10ADFF10 HTTP 1.1" 404 720 "http://buttercup-shopping.com/cart.do?action=view&itemId=EST-6&product_id=F1-SW-01" "Mozilla/5.0 (Windows NT 5.1; SV1; .NET CLR 1.1.4322)" "00000000-0000-0000-0000-000000000000"

```

# Event sampling

---

"We're gonna need a bigger sample"

# Event sampling

Sampling 1:10

✓ 225,672 events (before 8/1/17 5:21:32.000 AM)

Sampling 1 : 10 ▾

Each event has a 1 in 10 chance of being included in the result set.

9.5s

- ▶ No sampling covers 2,251,967 events (baseline)
- ▶ 1:10 sampling covers 225,672 events

Generally,  
1:10 is 10× faster,  
1:100 is 100× faster, etc.

# Summary indexing

---

Search. Reduce. Recycle.

# Summary indexing (SI)

Searching against the summary index

<1s

- ▶ Original search:  
`index=meraki sourcetype=meraki_syslog log_type=urls`  
`| stats dc(mac)`
- ▶ Summary index search:  
`index=summary search_name=conf_2017_si`  
`| stats dc(mac)`

# Summary indexing (SI)

The summarizing search that goes into the SI

- ▶ Summary-populating search called "conf\_2017\_si" runs every hour and looks back one hour<sup>[1]</sup>:

```
index=meraki sourcetype=meraki_syslog log_type=urls
| sistats dc(mac) by device
```

:8E:C8;164;"
```

"Mysterious" fields created by **sistats**

<sup>[1]</sup>Backfilled the SI using:

```
./splunk cmd python fill_summary_index.py -app conf_2017 -name
conf_2017_si -et 1500447600 -lt 1500534000 -owner admin
```

# Summary indexing

## Pros and cons

- ▶ Also useful for having a "cleaner" copy of the data or hardcoding calculated or lookup values to the summary
- ▶ Has all the same functionalities of an index: RBAC, data retention, clustering replication, etc.

- ▶ Can't go more granular than the summary's scheduled interval
- ▶ Can have gaps or overlaps
- ▶ Backfilling is a manual python script
- ▶ Impossible to search outside the summarized time range
- ▶ Messing up the summary is the worst

# Report acceleration

---

The "that was easy" button

# Report acceleration (RA)

Simply check a box and select a summary range

Create a saved search and enable RA

Name	Actions	Acceleration Status
conf_2017_ra	Edit Run	<span>This model is accelerated.</span> ⚡ none

Some similar searches (even ad-hoc) will automatically use the RA summary

# Report acceleration (RA)

## Pros and cons

- ▶ Very easy to enable
- ▶ Has a summary time range to easily control the size of the RA
- ▶ Searching outside the summary time range will automatically fall back to a regular search
- ▶ Similar searches automagically uses the RA summary
- ▶ Similar searches automagically *not* using the RA summary (just switching the order of the search terms tricks Splunk to not use the RA summary, ie foo=A bar=B vs bar=B foo=A)

# DATA MODEL ACCELERATION!

The big daddy of search acceleration

# DATA MODEL (DM) ACCELERATION

Regular vs tstats search format

- ▶ Regular search:  
`index=meraki sourcetype=meraki_syslog log_type=urls`  
| `sistats dc(mac) by device`  
| `stats dc(mac)`
- ▶ DM (tstats) search:  
| `tstats prestats=t dc(all.mac) from datamodel=conf_2017`  
by all.device  
| `stats dc(all.mac)`

130.60.4 - - [07/Jan 18:10:57:153] "GET /category.screen?category\_id=GIFTS&JSESSIONID=5D5L9FFIADFF3 HTTP/1.1" 404 720 "http://buttercup-shopping.com/cart.do?action=view&itemId=EST-6&product\_id=FI-5W-03" "Mozilla/5.0 (Macintosh; Intel Mac OS X 11\_0\_2) AppleWebKit/537.73.2 Safari/537.73.2" "128.241.220.82 - - [07/Jan 18:10:57:123] "GET /product.screen?product\_id=FL-DSH-01&JSESSIONID=5D5L9FFIADFF3 HTTP/1.1" 200 1318 "http://buttercup-shopping.com/cart.do?action=remove&itemId=EST-18&product\_id=AV-CB-01&JSESSIONID=5D5L9FFIADFF3" "Mozilla/5.0 (Macintosh; Intel Mac OS X 11\_0\_2) AppleWebKit/537.73.2 Safari/537.73.2" "317 27.160.0.0 - - [07/Jan 18:10:56:156] "GET /oldlink?item\_id=EST-26&JSESSIONID=5D5L9FFIADFF3 HTTP/1.1" 200 385 "http://buttercup-shopping.com/cart.do?action=remove&itemId=EST-26&product\_id=RP-LI-02" "Mozilla/5.0 (Macintosh; Intel Mac OS X 11\_0\_2) AppleWebKit/537.73.2 Safari/537.73.2" "130.60.4 - - [07/Jan 18:10:57:153] "GET /category.screen?category\_id=GIFTS&JSESSIONID=5D5L9FFIADFF3 HTTP/1.1" 404 720 "http://buttercup-shopping.com/cart.do?action=view&itemId=EST-6&product\_id=FI-5W-03" "Mozilla/5.0 (Macintosh; Intel Mac OS X 11\_0\_2) AppleWebKit/537.73.2 Safari/537.73.2" "128.241.220.82 - - [07/Jan 18:10:57:123] "GET /product.screen?product\_id=FL-DSH-01&JSESSIONID=5D5L9FFIADFF3 HTTP/1.1" 200 1318 "http://buttercup-shopping.com/cart.do?action=remove&itemId=EST-18&product\_id=AV-CB-01&JSESSIONID=5D5L9FFIADFF3" "Mozilla/5.0 (Macintosh; Intel Mac OS X 11\_0\_2) AppleWebKit/537.73.2 Safari/537.73.2" "317 27.160.0.0 - - [07/Jan 18:10:56:156] "GET /oldlink?item\_id=EST-26&JSESSIONID=5D5L9FFIADFF3 HTTP/1.1" 200 385 "http://buttercup-shopping.com/cart.do?action=remove&itemId=EST-26&product\_id=RP-LI-02" "Mozilla/5.0 (Macintosh; Intel Mac OS X 11\_0\_2) AppleWebKit/537.73.2 Safari/537.73.2"

# DATA MODEL (DM) ACCELERATION

Regular vs tstats search format

## Simple example:

```
index=meraki sourcetype=meraki_syslog log_type=urls | stats dc(mac)
```

```
| tstats dc(all.mac) from datamodel=conf_2017
```

## Advanced example:

```
index=meraki sourcetype=meraki_syslog log_type=urls | sistats dc(mac) by device | stats dc(mac)
```

```
| tstats prestats=t dc(all.mac) from datamodel=conf_2017 by all.device | stats dc(all.mac)
```

# DATA MODEL (DM) ACCELERATION

## Creating the data model

### Before using tstats, you must create a DM<sup>[1]</sup>

The screenshot shows the Splunk Data Model configuration page for a dataset named 'all'. At the top, there are buttons for 'Edit', 'Download', 'Pivot', and 'Documentation'. Below this, the dataset name 'all' is shown with 'Rename' and 'Delete' options. A 'CONSTRAINTS' section contains the constraint 'index=meraki sourcetype=meraki\_syslog log\_type=urls'. Below that is a 'Bulk Edit' button and an 'Add Field' button. The 'INHERITED' section lists fields: '\_time' (Time), 'host' (String), 'source' (String), and 'sourcetype' (String), each with an 'Override' link. The 'EXTRACTED' section lists 'device' (String) and 'mac' (String), each with an 'Edit' link. A note at the bottom states: 'Calculated fields are processed in the order above, so ensure any dependent fields are defined first. Drag to rearrange.'

Keep this name short!  
(you'll be typing this a lot)

Only root events can be accelerated

List the fields you will use later in tstats

<sup>[1]</sup>You can actually use tstats without a DM, but you can only use index-time fields (default fields like host, sourcetype, etc. or indexed extraction fields)

# DATA MODEL (DM) ACCELERATION

Accelerating the data model

You can actually use tstats searches on an unaccelerated DM.

This way you can review and check that all fields are accounted for before accelerating the DM.

Edit Acceleration

Data Model conf\_2017

Accelerate  Acceleration may increase storage and processing costs.

Summary Range? All Time ▾

If a tstats searches outside the summary range, then it will automagically convert that part to a regular search (like RA).

# DATA MODEL (DM) ACCELERATION

What really happens when you accelerate a DM

DM acceleration basically creates a compressed, optimized summary table (.tsidx files) on the indexers where

- ▶ rows = # of root events within the summary range
- ▶ columns = # of fields in the DM

	<b>_time</b>	<b>host</b>	<b>...</b>	<b>device</b>	<b>mac</b>
<b>event 1</b>	1501634605	meraki	...	GRE_003_AP2	00:00:3F:2E:4B:3A
<b>event 2</b>	1501634662	meraki	...	GRE_003_AP2	00:03:AB:11:4B:7D
<b>event 3</b>	1501634705	meraki	...	GRE_003_AP3	00:08:22:72:6C:3A
<b>...</b>	...	...	...	...	...

Therefore size of DM ~ rows × columns

# DATA MODEL (DM) ACCELERATION

## DM acceleration cost

i	Title ^	Type	⚡

DM summary lives on the indexers<sup>[1]</sup> and is only 37 MB total!

Is this worth speeding up the search by almost 100x?

YES!

<sup>[1]</sup>DM summary lives in  
`$SPLUNK_DB/<index_name>/datamodel_summary/<bucket_id>_<indexer_guid>/<search_head_guid>/DM_<app>_<data_model_name>`

# DATA MODEL (DM) ACCELERATION

Pros and cons

- ▶ Reusability: one DM can feed many searches
- ▶ Summaries can be replicated in a cluster (not by default)
- ▶ Also useful for hardcoding calculated or lookup values to the summary (like in SI)
- ▶ Tstats can still search outside the summary range

- ▶ Requires creating an accelerated DM first
- ▶ May need to manually convert old searches to tstats and not all searches can be converted
- ▶ Need to stop and re-accelerate the DM to modify it
- ▶ Tstats is only fast for "reducing" searches

# Batch mode search parallelization

Because two is better than one

# Batch mode search parallelization

What it is and where to set this setting

Set limits.conf on indexers:

```
[search]
```

```
batch_search_max_pipeline = 2
```

- ▶ The default is 1
- ▶ 2 is the best value (higher values succumbs to diminishing returns)

Batch mode search parallelization allows launching multiple search pipelines per qualifying search<sup>[1]</sup>, which are processed concurrently.

N/A

[1] Only for "batch mode" searches, which are searches that are distributed (ie not time-ordered searches like streamstats, transaction, head, etc.)

# Batch mode search parallelization

## Pros and cons

- ▶ Faster searches by using up more resources (IO, processing, and memory)

- ▶ Only for the rich
- ▶ Only works on "batch mode" searches

```

```

# Review

The final countdown!

	Definition
Scheduled search	Caching fixed time range search results
Post-process searches	Creating a "data cube" to power multiple other searches
Event sampling	Randomly sampling every 1 out of X events
Summary indexing	Reducing the number of events by reducing the time "resolution" to a new index
Report acceleration	The lazy version of data model acceleration
<b>DATA MODEL ACCELERATION</b>	Create a data model, then use it via tstats
Batch mode search acceleration	Don't worry about this unless your Splunk is heavily underutilized.

# Mix and match!

---

"No seriously, I have nothing to wear!"

# Mix and match!

## The sky is the limit

### Examples:

- ▶ DMs off of SI
- ▶ Post-process searches off of a scheduled search
- ▶ RA off of SI
- ▶ Tstats to create SI
- ▶ Scheduled search off of tstats
